

Vlad Pisotskyi

Full-Stack Engineer — AI Platform

San Francisco, CA • [LinkedIn](#) • [GitHub](#)

SUMMARY

AI-platform engineer specializing in RAG and agentic retrieval systems, full-stack across React/Next.js and Node. Benchmark LLM pipelines head-to-head against real production traffic to settle what actually ships, diagram architecture, and build live demo artifacts to align non-technical stakeholders on technical tradeoffs.

KEY SKILLS

Front-End: React, Next.js, TypeScript, JavaScript, HTML, CSS, Tailwind, Vitest, Playwright, Git

Backend: Node.js, Express, REST APIs, Python, MongoDB, PostgreSQL, CosmosDB, Docker

AI & Other: LangChain, LangGraph, Langfuse, OpenAI, Anthropic, AWS, Azure, Redis, BullMQ

WORK EXPERIENCE

Code the Dream, *Full-Stack Developer*

11/2024 – Current

AI/RAG Architecture & Evaluation:

- Built a LangGraph route for a benefits chatbot with MMR retrieval, a two-layer citation validator, and MongoDB-backed checkpointed memory, cut hallucinated citations by ~15% and replaced raw message-history context with a summary + last-4-messages window refreshed every 4 turns
- Explored chunk-and-embed's limits by building a wiki-retrieval route: a tool-calling agent with list, search, and read-file tools that reasons directly over the full policy corpus instead of vector embeddings and resolves citations to deterministic server-side IDs. Benchmarked it against a vector-search baseline on the same policy corpus
- Delivered a three-part chat-evaluation harness (Claude skills, LLM-as-a-judge) for systematic bottleneck analysis: diagnosed flagged conversations from DB and Langfuse traces, replay-tested any route via Locust, and compared routes side by side to pinpoint exactly where each engine struggles

Platform Engineering & Delivery:

- Centralized authorization auditing behind a Logger class wired into the CASL Ability layer, and LangChain chain caching behind a purpose-built manager class, and cut per-action boilerplate to one integration point apiece
- Designed and created a feedback system for a benefits chatbot end to end: a Headless UI v2 popover with full keyboard navigation and ARIA/screen-reader support, predefined reasons and free-text, PII-redacted and Zod-validated, and written to the database and to Langfuse as a categorical score tied to the exact message trace
- Diagnosed a competing-consumers bug dropping BullMQ jobs between two Redis-connected servers, then carried the same instrumentation discipline into Locust load tests and Airbrake deduplication
- Rebuilt an internal RAG evaluation dashboard, replaced an 853-line monolithic client-side page with modular Server Actions and live polling, and swapped a wide, horizontally-scrolling runs table for a compact redesign

SELECTED TECHNICAL PROJECTS

Personal Project: [Portfolio](#), *Full-Stack Developer* | [GitHub](#)

- Built and shipped a production Next.js 16 site solo in 2.5 weeks, test-first with 367 unit and 50 Playwright E2E tests written before each feature, CI-gated on every push, and included axe accessibility scans in both color themes
- Implemented a production AI chat with Vercel AI SDK v6: streaming, tool calls (live calendar scheduling, bio lookup), with every tool state (pending, success, error) rendered distinctly in the UI
- Wired a multi-provider AI chat with silent same-request failover from Gemini to Claude Haiku behind a circuit breaker that distinguishes auth misconfigurations from real provider outages

Hackathon Project: [Chef Jul](#), *Full-Stack Developer* | [GitHub](#)

- Led a 3-person team to 2nd place at the MetLife Hackathon 2025 with an AI meal-planning app built in three days, planned the project end to end, features, data flow, and division of work, then owned the entire AI layer: the Cloud Functions backend, the primary planner, and the in-dashboard sous-chef assistant
- Launched a fire-and-forget background pipeline that generates all 21 recipes for a weekly meal plan in parallel batches of 5, tracks live progress in a Firestore status document, checks a cancel flag before every batch so a user can stop it mid-run, and still advances on a per-meal failure so the UI never stalls waiting on one bad generation

EDUCATION

React, Node.js, Python and Advanced Practicum | Code the Dream Certificate

Software Engineer Immersive Program | Hack Reactor

Bachelor of Arts in International Affairs | Kyiv International University
